

# Project Handover Checklist

**Project:** Takween Tutors App — Mobile Companion

This checklist mirrors the 14-point handover format used for the Prayer Times App, scoped to the Takween Tutors mobile companion app (see *Takween\_Tutor\_mobile\_Brief*). The repository, its commit history, and its dependencies are real and verified directly from the codebase; narrative fields that depend on the developer's own account of the build — and haven't happened yet — are marked *Pending* rather than invented.

## Handover List:

**1. Live public form link** — N/A (this is a standalone mobile application, not a web form)

**2. Live admin panel link** — N/A

**3. Admin login email** — N/A

**4. Admin login password** — N/A

**5. GitHub repository link** — <https://github.com/takweentutors1/takween-tutor-mobile>

**6. GitHub commit links / summary** — Most recent commits on `main`:

- `606bbc6` — test: fix widget test harness
- `b80274c` — feat: Add Quick Actions (App Shortcuts) setup
- `95142d9` — feat: FCM push notifications, native permissions, and full device onboarding coverage
- `23737a9` — polish: motion tokens, native splash/icons/onboarding, state-machine audit
- `88ec32d` — fix: responsive + accessibility pass across device matrix

*App-store build artifacts (APK/AAB/xcarchive) are pending — not yet published to a release, unlike the Prayer Times App's tagged release commits.*

**7. Loom screen recording link** — *Pending — not yet recorded. Per the brief, this should show app launch, browsing subjects, a subject's detail view, the enquiry flow, logging in, the dashboard, and behaviour with no internet or no login.*

**8. What I Built — plain-English summary** — *Pending — to be written by the developer at submission.*

**9. Tools used** — Built in Flutter/Dart. State management and dependency injection via `get` (GetX). Networking via `dio`. Authentication and push notifications via `firebase_auth`, `firebase_core`, and `firebase_messaging`, with `flutter_local_notifications` for on-device notification handling and `quick_actions` for home-screen app shortcuts. `get_storage` and `flutter_dotenv` handle local persistence and config/secrets exclusion. `connectivity_plus` monitors network state, `cached_network_image` and `shimmer` handle image loading and loading-state UI, and `flutter_screenutil` / `google_fonts` support responsive layout and typography.

**10. Problems encountered and how resolved** — *Pending — to be completed by the developer at submission.*

**11. How to test the project** — Clone the repository, run `flutter pub get` to install dependencies, then launch via Android Studio or Xcode (or `flutter run` with a connected device/emulator). *Any test login details, once the dashboard/auth flow is submission-ready, to be added by the developer.*

**12. Known limitations** — *Pending — no build has been submitted for QA review yet against this brief (see Takween\_Tutor\_Mobile\_QA\_Report, currently PENDING). Limitations will be logged once a submission is reviewed.*

**13. Product Thinking Answer** — *Pending — the developer's full answer to the Path to Production question in Takween\_Tutor\_mobile\_Brief (shared foundation with the Prayer Times app, real-vs-sample dashboard data readiness, and public-listing preparation).*

**14. Final README link, if separate from GitHub README** — *Pending — the repository's README is currently the default Flutter scaffold placeholder and has not yet been written up for this project.*

**Submission Date:** *Pending*
