

Takween Tutor — Mobile App: Project Tracker

This document tracks the main stages of the Takween Tutors companion app build. Check off the stages as the project progresses to final delivery.

Phase 1: Setup & Architecture

- ☐ **Project Initialization:** Scaffold the Flutter project with a layered folder structure (core, data, domain, presentation), carried over from the Prayer Times app's foundation.
- ☐ **Dependency Configuration:** Add and configure networking, state management, and the Supabase/REST client libraries needed to talk to the Takween Tutors API.
- ☐ **Platform Preparation:** Configure Android and iOS permissions, usage strings, and app identifiers distinct from the Prayer Times app.

👉 **Test Environment:** *iOS Simulator or Android Emulator (to verify clean build and app identifiers).*

Phase 2: Content & Data Layer

- ☐ **Content Audit:** Catalogue takweentutors.com's live subject list, exam boards (AQA, OCR, Edexcel), and tutor-facing content to mirror faithfully — no invented content.
- ☐ **Domain Modeling:** Implement typed models (Subject, Tutor, Lesson, EnquiryForm, DashboardSummary).
- ☐ **API / Content Integration:** Wire up real endpoints where a usable one exists, or a structured sample data layer matching the real dashboard's fields where it doesn't.

👉 **Test Environment:** *No device needed (headless data-layer tests).*

Phase 3: Authentication & State Management

- ☐ **Login Screen:** Build the login flow against the live platform's authentication.
- ☐ **Local Persistence:** Cache the last successful session/dashboard payload for offline fallback.
- ☐ **Reactive State Layer:** Wire state controllers for auth, subjects, and dashboard data.

👉 **Test Environment:** *Real iOS/Android Device (auth flows and token handling are best verified off-simulator).*

Phase 4: Primary User Interface

- ☐ **Explore Subjects Screen:** Build subject list/detail views matching takweentutors.com content and branding.
- ☐ **Tutor Information Screen:** Mirror whatever tutor-facing content genuinely exists on the live site.
- ☐ **Enquiry / Free Consultation Form:** Recreate the website's enquiry flow as a native form with the same fields.
- ☐ **Widget Testing:** Verify subject list rendering, tutor detail rendering, and form validation.

👉 **Test Environment:** iOS Simulator or Android Emulator (great for rapid UI iteration and hot-reloading).

Phase 5: Student/Parent Dashboard (Core Feature)

- ☐ **Dashboard Skeleton:** Build the upcoming-lesson, tutor-info, and progress-overview layout.
- ☐ **Zoom Access:** Implement the join-link flow for the upcoming lesson.
- ☐ **UI State Integration:** Connect the dashboard to the chosen data source, handling loading, populated, and error states.

👉 **Test Environment:** Real iOS/Android Device (to verify actual Zoom deep-linking behaviour).

Phase 6: Resilience & Polish

- ☐ **Edge-Case Handling:** Graceful fallback for failed/denied login (retry + continue browsing) and offline states (last-loaded data or a clear message).
- ☐ **Visual Polish:** Apply Takween Tutors' colours, typography, and tone across native components.
- ☐ **Responsive Matrix Verification:** Ensure layouts hold up across small phones and large tablets.

👉 **Test Environment:** Real iOS/Android Device (required for toggling Airplane Mode to test offline states) AND multiple Simulators/Emulators (e.g., iPhone SE, iPad, Android Tablet) for the responsive matrix.

Phase 7: QA, Distribution & Submission

- ☐ **Final QA Pass:** Full integration testing (login, subject browsing, enquiry submission, dashboard, no-login/no-internet states).
- ☐ **App Distribution:** Create a signed AAB for Google Play Console (internal testing) and an Xcode archive for Apple TestFlight.
- ☐ **Submission Deliverables:** Record a 2–4 minute Loom walkthrough and complete the 12-point submission document (including the Path to Production answer).

👉 **Test Environment:** Real iOS/Android Devices (final physical QA before release) via TestFlight and Google Play Internal Testing.
