

Project Handover Checklist

Project: AcePharm Mobile App — iOS & Android Companion

This checklist mirrors the 14-point handover format established across Takween Digital mobile projects (such as the Prayer Times and Takween Tutors mobile applications), scoped specifically to the AcePharm cross-platform companion app (Flutter / Dart targeting iOS and Android). Repository paths, commit logs, Flutter dependencies, and generated release binaries are verified directly against the live mobile-app workspace; narrative fields reflecting active QA re-audits and store submissions are noted accurately.

Handover List:

1. **Live public form link** — *N/A* (Standalone native cross-platform mobile application, not a public web form).
2. **Live admin panel link** — *N/A* (Admin authoring and question curation are managed via the web portal).
3. **Admin login email** — *N/A*
4. **Admin login password** — *N/A*
5. **GitHub repository link** — <https://github.com/takweentutors1/acepharm-web-app> (Directory: mobile-app/).
6. **GitHub commit links / summary** — Most recent verified mobile commits on main:
 - e567199 — *chore(mobile): build v0.1.2 release APK for manual QA*
 - 92a9d1b — *fix(mobile): add missing signup consent UI and name field*
 - 67d510d — *chore(mobile): sync pubspec.lock with flutter_svg dependency*Release binary generated: mobile-app/release/acepharm-v0.1.2-release.apk (SHA-1 verified).
7. **Loom screen recording link** — **Pending** — Not yet recorded. Per the mobile brief, video walkthrough must demonstrate: cold app launch, 5-step onboarding sequence, configuring a 20-question session in the Session Builder, answering with mandatory confidence rating, reading full explanations with per-option rationales, querying Ask Ace with citation rendering, progress dashboard analytics, and Airplane Mode offline attempt queueing and sync.
8. **What I Built — plain-English summary** — Engineered the official native companion mobile application for AcePharm in Flutter/Dart, targeting iOS and Android. Brings the core web platform capabilities to mobile devices: (1) Fluid touch-optimized question engine supporting Learn and Timed modes; (2) Strict clinical answering rules capturing confidence before submission with multi-modal feedback; (3) Contextual Ask Ace AI tutor client with streaming citations; (4) Five distinct performance metrics and 6-stage Topic Map; and (5) Hospital-ward offline resilience allowing uninterrupted revision with background synchronization.
9. **Tools used** — Built in Flutter 3.x / Dart. **State Management & Architecture:** Layered clean architecture (core, data, domain, presentation). **Networking & Storage:** dio for API integration, flutter_secure_storage for Keychain/Keystore JWT tokens, and hive / hive_flutter for offline attempt queueing. **Monitoring & Analytics:** firebase_core, firebase_crashlytics, and firebase_analytics. **UI & Polish:** google_fonts (Geist font pairing), flutter_svg, url_launcher, and connectivity_plus for network monitoring.
10. **Problems encountered and how resolved** — Key technical challenges resolved: (1) *Offline attempt persistence:* Implemented local Hive queueing so question answers submitted during hospital connectivity dropouts are preserved with timestamps and synced automatically upon reconnection; (2) *Touch ergonomics:* Expanded touch targets across option tiles and explanation accordions to satisfy the 44×44pt minimum; (3) *SVG rendering:* Resolved cross-platform icon artifacting by upgrading to flutter_svg 2.0.10.
11. **How to test the project** — Clone repository, navigate to mobile-app/, and execute flutter pub get. Run automated test suite (116 unit/widget tests) via flutter test. Launch on iOS Simulator or Android Emulator via flutter run. For physical device QA, install mobile-app/release/acepharm-v0.1.2-release.apk. Test offline mode by launching a session, toggling Airplane Mode, answering 5 questions, re-enabling network, and verifying server sync.
12. **Known limitations** — Currently undergoing QA remediation (see acepharma_mobile_QA.pdf): (1) Offline attempt timestamp synchronization being hardened against backoff edge cases (MOB-01); (2) Account deletion endpoint integration being wired server-side for Apple Guideline 5.1.1 compliance (MOB-03); (3) Timed mode explanation suppression prior to session completion being enforced (MOB-04).
13. **Product Thinking Answer** — Comprehensive written response to Path to Production plan: (1) *Takween Mobile Foundation:* Reusing proven networking and auth patterns across Prayer Times, Takween Tutors, and AcePharm; (2) *Contract-First Synchronization:* Aligning mobile DTOs with Next.js REST endpoints via mock fixtures to ensure zero rework; (3) *App Store Monetization Compliance:* Adhering to Apple Reader App exceptions to display subscription status without external payment links.
14. **Final README link, if separate from GitHub README** — <https://github.com/takweentutors1/acepharm-web-app/blob/main/mobile-app/README.md> (Mobile setup, build instructions, and release notes).

Submission Date: 18/09/2026 (Pending QA Re-audit)
