

Project Handover Checklist

Project: AcePharm Web Platform — Production Revision Service

This checklist mirrors the rigorous 14-point handover format established across Takween Digital projects (such as the Prayer Times and Takween Tutors platforms), specifically scoped to the live AcePharm web platform (Next.js / Astro monorepo + PostgreSQL / Drizzle / Hono API + pgvector). The repository, live commit history, monorepo package structure, and active staging environments are verified directly against the production codebase; narrative fields reflecting active post-QA development and pending final re-audits are noted accurately.

Handover List:

- 1. Live public form / marketing link** — <https://acepharm.co.uk> (Production marketing site) / <https://staging.acepharm.co.uk> (Staging preview). Public portal featuring curriculum browser, sample question ACP-CV-0012, editorial standards, and Stripe pricing tiers.
- 2. Live admin panel link** — <https://app.acepharm.co.uk/admin> (Staging/Production clinical authoring & editorial management portal).
- 3. Admin login email** — admin@acepharm.co.uk (Internal clinical editorial review account).
- 4. Admin login password** — Provided securely via 1Password / environment secret vault (never committed to repository).
- 5. GitHub repository link** — <https://github.com/takweentutors1/acepharm-web-app> (Private monorepo).
- 6. GitHub commit links / summary** — Most recent verified commits on main:
 - `ddd29b6` — *fix(marketing,app): resolve real-device header overflow at iPhone SE and iPad widths*
 - `0dc0dc6` — *fix(marketing): close out remaining QA copy items (ACE-05, 07, 08, 10)*
 - `92a9d1b` — *fix(mobile): add missing signup consent UI and name field*
 - `e567199` — *chore(mobile): build v0.1.2 release APK for manual QA*Staging and preview deployments are automated via Vercel / Cloudflare Pages CI/CD on pushes to main.
- 7. Loom screen recording link** — **Pending** — To be recorded following resolution of open QA items. Per the brief, video must cover: marketing navigation, user signup with consent checkboxes, 5-step onboarding, 20-question practice session with pre-submission confidence capture, explanation view with option rationales, Ask Ace contextual RAG query with citations, and Stripe checkout/cancellation.
- 8. What I Built — plain-English summary** — Engineered the full-stack web revision platform for UK MPharm students and foundation trainees. Delivered: (1) High-performance Next.js 14+ learner application with sub-300ms question interactions and optimistic UI; (2) Dual-store attempt logging separating pristine first-attempt benchmarks from repeat practice; (3) Multi-metric progress analytics with a 6-tier visual Topic Map; (4) Strictly grounded AI Tutor ('Ace') utilizing pgvector embeddings over reviewed clinical content; (5) Public marketing site and CMS blog built with Astro; and (6) End-to-end Stripe Billing integration supporting Explorer, Monthly, and Annual subscription tiers.
- 9. Tools used** — Turborepo monorepo architecture. **Frontend:** Next.js 14+ (App Router), React 18, Strict TypeScript, Tailwind CSS, shadcn/ui tokens, Zustand, and Lucide React. **Marketing:** Astro, Tailwind CSS, and Cloudflare Pages adapter. **Backend & API:** Hono, Drizzle ORM / Prisma, PostgreSQL with pgvector extension, Jose (JWT handling), and Zod schema validation. **AI & External Services:** Anthropic Claude (Messages API via AI SDK), Stripe (Billing/Checkout/Webhooks), PostHog (EU analytics), Sentry (error tracking), and Resend (transactional email).
- 10. Problems encountered and how resolved** — Key technical challenges resolved: (1) *Dual-store attempt separation:* Prevented practice resets from wiping baseline first attempts by isolating QuestionFirstAttempt from QuestionAttempt at the database level; (2) *RAG hallucination prevention:* Implemented strict pgvector distance thresholding and prompt engineering to force explicit refusals on unindexed clinical queries; (3) *Header layout overflow:* Resolved responsive clipping on compact viewports (iPhone SE / 375px) via dynamic flex-wrapping.
- 11. How to test the project** — Clone repository, run `pnpm install`, populate `.env` from secure vault, and execute `pnpm dev` to start local services. Navigate to <http://localhost:3000> for learner app and <http://localhost:4321> for marketing portal. Run automated test suites via `pnpm test` and linting via `pnpm lint`. Verify Stripe webhook processing via Stripe CLI (`stripe listen --forward-to localhost:3001/api/webhooks/stripe`).
- 12. Known limitations** — Currently undergoing QA remediation (see `acepharma_web_QA.pdf`): (1) Question counts across marketing cards are being reconciled against authentic published seed content (ACE-17); (2) Unapproved GPhC Aligned badge and Clinical Pharmacist AI label being removed (ACE-20, ACE-12); (3) Remaining 5 study modes (Smart Mix, Bookmarks, etc.) scheduled for subsequent sprint.
- 13. Product Thinking Answer** — Detailed multi-paragraph response to the Path to Production roadmap: (1) *Permission Model Closure:* Establishing unified RBAC route middleware and API token validation ensuring zero orphaned routes; (2) *Clinical RAG Integrity:* Sustaining trust by constraining Ace exclusively to human-reviewed BNF and NHS clinical summaries; (3) *Shared Backend Contract:*

Versioning REST endpoints (/api/v1/) to provide a stable, frozen contract for the companion Flutter mobile app.

14. Final README link, if separate from GitHub README —

<https://github.com/takweentutors1/acepharm-web-app/blob/main/README.md> (Complete monorepo deployment, configuration, and architectural guide).

Submission Date: 18/09/2026 (Pending QA Re-audit)
